Ex. No: 9   **DEADLOCK AVOIDANCE**

Date: 02.04.2025

Aim:

To find out a safe sequence using Banker's Algorithm for deadlock avoidance.

Algorithm:

1. Initialize work = available and finish[i] = false for all processes i.

2. Find an i such that both:

    o   finish[i] == false and

    o   need[i] <= work

3. If no such i exists, go to step 6.

4. Update: work = work + allocation[i].

5. Set finish[i] = true and go to step 2.

6. If finish[i] == true for all i, then a safe sequence exists. Print the safe sequence.

7. Else, print that no safe sequence exists (i.e., deadlock may occur).

Program Code :

```
 #include <stdio.h>
#define P 5
#define R 3

int main() {
    int allocation[P][R] = {{0, 1, 0}, {2, 0, 0}, {3, 0, 2}, {2, 1, 1}, {0, 0, 2}};
    int max[P][R] = {{7, 5, 3}, {3, 2, 2}, {9, 0, 2}, {2, 2, 2}, {4, 3, 3}};
    int available[R] = {3, 3, 2};
    int need[P][R], finish[P] = {0}, safeSeq[P];
    int work[R];
```

```c
    for (int i = 0; i < P; i++)
        for (int j = 0; j < R; j++)
            need[i][j] = max[i][j] - allocation[i][j];

    for (int i = 0; i < R; i++)
        work[i] = available[i];

    int count = 0;
    while (count < P) {
        int found = 0;
        for (int i = 0; i < P; i++) {
            if (!finish[i]) {
                int j;
                for (j = 0; j < R; j++)
                    if (need[i][j] > work[j])
                        break;
                if (j == R) {
                    for (int k = 0; k < R; k++)
                        work[k] += allocation[i][k];
                    safeSeq[count++] = i;
                    finish[i] = 1;
                    found = 1;
                }
            }
        }
        if (!found) {
            printf("System is not in a safe state.\n");
            return 1;
        }
    }

    printf("The SAFE Sequence is:\n");
    for (int i = 0; i < P; i++)
        printf("P%d ", safeSeq[i]);
```

```
    printf("\n");

    return 0;
}
```

Sample Output:

The SAFE Sequence is:

P1 P3 P4 P0 P2

Result:

Thus, the Banker's Algorithm was successfully implemented to determine the safe sequence for deadlock avoidance.
